STUDY ON THE NUTRITIONAL VALUES AND CUSTOMER ACCEPTANCE OF Lansiumdomesticum& Nepheliumlappaceum NEWLY FERMENTED NATURAL FRUIT VINEGARS IN MALAYSIA

Seri Intan Mokhtar ^a, Faznira Zakaria ^b, Mohammad Amizi A ^c, Siow Woon Soon ^d, Nurshahida. A.S ^e, Zul Ariff Abdul Latiff ^f ^{abcdef}University Malaysia Kelantan, Jeli Campus, Kelantan, Malaysia *Corresponding email*: intan@umk.edu.my

Abstract

Every fruit season, the orchard farmers are facing fruit overloading leading towards fruit dumping. *Nepheliumlappaceum* (local name: Rambutan) and *Lansiumdomesticum* (local name: Dokong) vinegars were produced by natural microbial fermentation to overcome the dumping problem. The vinegars nutritional values and customer acceptance studies were conducted to compare against commercially available vinegars in Malaysia. Rambutan and Dokong vinegars nutritional value were shown to contain the same carbohydrate, protein and fat value with the apple cider vinegar and Attap seed (nipa) vinegars. Both vinegars contained two times higher Potassium, four times lower Sodium and eight times higher calcium compared to Apple Cider Vinegar. The survey method by using the structured questionnaire was used as a tool for collecting data and information. A total of 177 respondents by using stratified random sampling filled up the questionnaire in a selected location in Kuala Lumpur and Kelantan to obtain the result on acceptance of this natural fruit vinegar product. The result indicated most of the customers preferred the vinegar from fruit compared to Attap seed (nipa) vinegar and artificial vinegar. In addition, Halal and nutrition value of the product are of concerned to the consumers.

Keywords: Nutritional value, Customer acceptance, Dokong, Rambutan, Vinegar.

1. Introduction

For centuries, vinegar has been part of the human diet as a condiment and food preservative, as well as the basis for simple remedies for people and animals. Usually, vinegar is made from several sugary and starchy material such as fruits, malt, sugar cane juice etc. by alcoholic and subsequent acetic fermentation (Tan, 2005). FAO/WHO defines vinegar as any liquid, fit for human consumption, produced exclusively from suitable products containing starch and/or sugars by the process of double fermentation, first alcoholic fermentation and then acetification. The residual ethanol content must be less than 0.5% in wine vinegar and less than 1% in other vinegars (FAO, 2000). According to Malaysian Food Regulation 1985, vinegar shall be a liquid product prepared from the alcoholic fermentation and subsequent acetous fermentation of any suitable food. Vinegar shall contain no less than 4% w/v of acetic acid and shall not contain any mineral acid. Vinegar may contain permitted preservative, caramel as a colouring substance and spices as permitted flavouring substance.

However, the production of natural vinegar is unfavourable among the manufacturers in Malaysia. Many of the producers refuse to produce natural vinegar due to several reasons such as the availability of the substrates and long fermentation time (6-8 weeks). Moreover, the price of synthetic vinegar is still much lower than natural vinegar in local market. Natural vinegar production has only been practised as a cottage industry in many states in Malaysia using

various types of agro-based products and by-products as substrates such as coconut sap, nipah sapand matured fruit juice. There was no standard practice being followed by the local farmers and entrepreneurs have thus resulted in interference of contaminants, non-hygienic processes and un-standardized percentage of aceticacid and nutrition information in the marketed vinegar (Othaman*et al*, 2014).

The market for vinegar is wide spread. It traditionally acts as preservative or condiment of food, vinegar also has been used for antiseptic and act as medicine for aches and gastric problems (Ali &Herani, 2013). Domestic use is limited but it is used in large quantities in restaurants, clubs, and canteens and by the caterers. There are some established brands in the market like Chings, Weikfield and others. There are many food products utilizing vinegar as ingredients indirectly such as ketchup, sauce, mayonnaise making the demands of vinegar increased steadily (Tan 2005). The trend in consuming natural vinegar in Malaysia is on the increase now, but mostly on imported vinegars such as apple cider, date and pomegranate vinegars. However, except for nipa and coconut vinegars, the tropical fruit vinegar in Malaysia has not been commercialized (Karim *et al*,2011). The customer's preference of vinegars in Malaysia is also under studied.

Therefore, the objective of this study is to make comparison of proximate values, mineral elements and heavy metals of locally made fruits vinegar from Rambutan and Dokongwith apple cider vinegar and nipah vinegar (Mas *et. al*, 2014). Forecast accounts were determined for both local fruits vinegars in requirement for economic feasibility of the Rambutan and Dokong vinegars in order to attract investment. Moreover, customer's preferences, knowledge and acceptance towards Rambutan and Dokong Natural vinegars were surveyed to support data on current trend in vinegar consumption in Malaysia.

2. Materials and method

2.1 Sample of vinegars for analysis

Fruits juice extracts of Rambutan and Dokongwere fermented for 42 days to produce vinegars. Apple cider and Nipa vinegars were purchased from supermarket in Kelantan. About 100ml samples were taken from each fruits vinegars for the proximate analysis.

2.2 Proximate analysis

2.2.1 Moisture content

The thermal drying method was used in the determination of moisture content of the samples. 10 ml of dried sample was weighed in triplicate and placed in crucibles. The crucibles were washed, dried, weighed and being filled with sample and then placed in an oven for drying at 105°C for 3hr, allowed to cool in a desiccator and then reweighed. The percentage moisture content was calculated by the following formula:

% moisture = $\frac{W_1 - W_2}{W_1} \times 100$ Where,

 W_1 = Weight of sample before drying W_2 = Weight of sample after drying

2.2.2 Total solid contents

Total solids were estimated by deducting percentage of moisture from hundred.

2.2.3 Crude fat

Extraction of the fat was carried out by Soxtec System. Aluminum cups were heated at 103 °C for 30 minutes and were dried in desiccator for 20 min, weighed and recorded. Samples were prepared by soaking a filter paper in 1 ml of the vinegar and were dried in oven at 103° C for 2 min. The samples were weighted in the thimbles and recorded. A layer of de-fatted cotton was placed on the top of the sample and was inserted into the extraction unit.

Each of the aluminum cups was filled with 80 ml petroleum ether and was inserted into the extraction unit with the cup holder and left to run for about 20 min. After the extraction process, the cups were removed, heated at 103 °C for 30 min in a drying oven and dried in desiccators for 20 min. All cups weights were recorded. Crude fat was determined by the following formula:

% Crude Fat = $\underline{W3-W2}$ x 100

W1 Where, W1 = weight of sample W2 = Weight of empty Aluminium cup W3 = Weight Aluminium cup + fat residue

2.2.4Crude protein

For the digestion process, 10 ml of distilled water, 12 ml of concentrated sulphuric acid, two pieces of Kjeldahl tablets and one gram of samples were inserted into a digestion tube. All digestion tubes were placed in an insert rack of the control unit and were heated at 400 °C for 1 hr. The samples were left to cool for at least 30 min in a fume hood.

For distillation process, the receiver solution was prepared by dissolving 4g of Boric acid in 100 ml distilled water to make 4% Boric acid. 1 ml Bromocresol green and 0.7 ml methyl red were added and stirred on a stirring hotplate with medium temperature to dissolve completely. 30 ml from the solution was pipetted into each receiver flask to starts the analysis until the receiver solution in the conical flask turned from red to green colour. The flask was removed and titrated against 0.1N Hydrochloric acid (HCl) for determination of Kjeldahl nitrogen, which in turn gave the protein content. The nitrogen percentage was calculated by the following formula:

N%= (*ml of sample – ml of blank*)*x normality of HCl x* 14.007 *x* 100 *Weight of sample (mg)*

Thus, protein content will be estimated by conversion of nitrogen percentage to protein (James, 1995).

Protein % = N% x Conversion factor (6.25) Where conversion factor = 100/N (N% in fruit products)

2.3 Determination of minerals and heavy metals

2.3.1 Preparation of samples

20ml of samples was placed in a 100 ml volumetric flask, 10 ml of HCl was added and the volume was marked up with distilled water and was filtered to remove solid particles. The standards for minerals and heavy metals were prepared containing the same acid and lanthanum concentration as samples. Dilutions for samples were necessary for elements present in high concentration. Lanthanum was used when detecting Potassium, Sodium, Magnesium and Calcium elements. Then, the standard at different concentration was run following with the samples using Atomic Absorption Spectroscopy (AAS).

2.4 Determination of forecast account

2.4.1 Determination of profit and loss statement

- Profit is determined by the money from sales, cost of stock and all the expenses.
- Sales= commissions paid / discounts given + cost of goods + gross profit
- Gross profit = variable + fixed expenses + net profit.
- Sales, gross profit and net profit are the income earned by the business.
- Cost of goods, commissions/discounts, variable and fixed expenses are business expenses.

2.4.2 Determination of NPV, IRR and ROI

- NPV= The present value of an investment's future net cash flows the initial investment
- IRR = The internal rate of return (IRR) is a rate of return used in capital budgeting to measure and compare the profitability of investments.
- Benefit/Cost ratio = Net present value / investment value
- ROI = Benefit Cost/Cost

2.5 Customer preferences towards fruit vinegars in Malaysia

A Survey was conducted to obtain the necessary data using questionnaires which were distributed to a sample size at two states, one in East Coast of Malaysia (Kelantan) and another one in The West Coast of Malaysia (Kuala Lumpur)by using the stratified randomized sampling to identify the difference perception and acceptance level towards the tropical natural fruit vinegars. A Total of 177 respondents answered the questionnaires of which 69 respondents from Kuala Lumpur and 108 respondents from Kelantan.

3. Results and Discussion

The proximate analysis data in local fruits vinegar and commercialized vinegar used for present investigation are presented in Table 1. The analytical data reveals showed that all of the values are p < 0.05 significantly different except for protein value (p > 0.05). Apple cider vinegar and nipa vinegar have the highest moisture value which is 98.49% and 96.17%, respectively while the local fruits vinegar moisture value range between 81.47% – 92.49%. For total solid content, Rambutan vinegars showed the highest value which is 18.53% and apple cider vinegar was the lowest, 1.51%. Total solids are measure of the amount of material dissolved in water. This material can include carbonate, bicarbonate, chloride, sulphate, phosphate, nitrate, calcium,

magnesium, sodium, organic ions and other ions (American Public Health Association, 1998). However, ash, carbohydrate and fiber content cannot be determined due to low residue content. Protein content were in the same range between all of vinegars where rambutan vinegar has the highest, 0.27% while apple cider vinegar has the lowest protein content which is 0.13%. Fat content was found highest in Dokong vinegar which is 0.59% and the lowest was found in rambutan and nipa vinegar which is 0.07%. The differences of pH value between local fruits vinegars with the apple cider vinegar were not obvious which local fruits vinegar range from 3.48 to 3.88 while apple cider is 3.10 and nipa vinegar is 2.86. The highest amount of total soluble solid (TSS) was found in Rambutan vinegar, 16.41 °Brix and the lowest in apple cider vinegar, 3.60 °Brix. Generally, higher TSS indicates more sugar in the pulp where the level of sugar in pulp shows the level of ripening of the fruits (Haque*et. al.*, 2009). Basically, 1 °Brix is equal to 1% of sugar content (USDA, 2011). For titratable acidity rambutanvinegar has the highest, 7.45% while apple cider and nipa vinegar ranges from 6.34% to 6.40%.

Table 1: Proximate Analysis of Fruit's Vinegars

	Rambutan Vinegar	Dokong Vinegar,	Apple Cider Vinegar	Nipa Vinegar
Moisture (%)	$81.47\pm3.13^{\mathrm{a}}$	92.59 ± 1.15^{b}	$98.49 \pm 0.15^{\circ}$	96.17 ± 0.09 bc
Total solid content (%)	$18.53 \pm 3.13^{\circ}$	7.41 ± 1.15^{b}	$1.51{\pm}0.15^a$	3.83 ± 0.09 ab
Ash (%)	0.00	0.00	0.00	0.00

* Energy is obtained from Fat (%)

The analytical data in Table 2 shown that that the mineral content in the local fruit vinegars was significantly different (p < 0.05). Potassium level was significantly higher in local fruit vinegars compare to apple cider vinegar and nipa vinegar where the highest was in dokong vinegar which is 387.67 mg/kg. Sodium was significantly lowest in nipah vinegar which is 61.79 mg/kg while highest in apple cider vinegar at482.37 mg/kg. Calcium was found to be lowest in commercialized vinegar whereby value is not detected in nipa vinegar and only 4.93 mg/kg in apple cider vinegar compared to rambutan vinegar at 39.15 mg/kg and Dokong at 15.25 \pm 1.51.Nipa vinegar has significantly lowest amount of magnesium at21.25 mg/kg. Rambutan vinegar has highest amunt of Magnesium at59.28 mg/kg. Results showed that the tropical fruits vinegar contained a moderate amount of manganese where rambutan vinegar has the highest at 2.06 mg/ kg and the lowest amount found in nipah vinegar at 0.02 mg/kg. The highest amount of zinc was found 21.11 mg/kg in apple cider vinegar and lowest level found in Nipa vinegar at 0.36 mg/kg.

Minerals (mg/kg)	Rambutan Vinegar	Dokong Vinegar,	Apple Cider Vinegar	Nipa Vinegar
Potassium, K	$250.23\ \pm 28.56^{b}$	$387.67 \pm 97.61^{\circ}$	133.30 ± 18.53^{ab}	101.15 ± 8.96^{a}
Sodium, Na	112.33 ± 28.54^{b}	97.47 ± 13.43^{ab}	$482.37 \pm 3.31^{\circ}$	61.79 ± 1.67^{a}
Calcium, Ca	39.15 ± 2.43^{d}	$15.25 \pm 1.51^{\circ}$	$4.93\pm0.08^{\rm b}$	ND^{a}
Magnesium, Mg	$59.28 \pm 11.61^{\text{b}}$	$44.97 \pm \ 18.81^{b}$	39.11 ± 0.10^{ab}	21.25 ± 0.63^{a}
Manganese, Mn	$2.06\pm0.21^{\text{d}}$	$0.89 \pm \ 0.03^c$	$0.55\pm0.07^{\rm c}$	$0.02\pm0.00~^a$
Zinc, Zn	$0.86\pm0.05^{\rm c}$	$0.56\pm\ 0.03^{b}$	21.11 ± 0.05^{d}	0.36 ± 0.03^{a}

Table 2: Mineral elements of Fruits' Vinegars

Values are expressed as mean \pm SD of triplicates measurements superscripts with different letters are significantly different at p < 0.05 within the same row

* ND = Not Detected

From the study, a trace heavy metals for lead was not detected in the entire sample except for nipa vinegar, at 0.16 ppm. Cadmium and chromium were also not detected in the entire sample. It is showed that the values for copper and nickel are significantly different (p < 0.05).The highest amount of copper was in rambutan vinegar, 0.87ppm while the lowest in nipa vinegar at 0.02 ppm. For Nickel, apple cider vinegar was the highest, 6.62 ppm and the lowest was found in dokong vinegar, 0.15 ppm. The acceptable range of Nickel in daily intake is 3-7mg/day (Ismail, *et. al.*, 2011). The higher levels of heavy metal contamination found in some fruit and vegetables could be closely related to the pollutants in irrigation water, farm soil, and pesticides or alternatively could be due to pollution from traffic on the highways (Othman & Mbogo, 2009).

Table 3: Heavy Metals in Fruits' Vinegars

Heavy metals (ppm)	Rambutan Vinegar	Dokong Vinegar,	Apple Cider Vinegar	Nipa Vinegar
Lead, Pb	ND ^a	ND ^a	ND ^a	0.16 ± 0.04^{b}

A profit and loss statement shows planned and actual profit for the business. Based on Table 4, it is showed thatrambutan and dokong vinegar is a profitable product. This is shown by the gross profit and profit/loss after taxation of both vinegars already gained profit in year 1. Gross profit for rambutan vinegar in year 1 is RM 38, 803 and by the year 5, it is increased to RM 56, 812 by assuming sales and purchases prices are up 10% every year. However, the gross profit for dokong vinegar is lower compare to rambutan vinegar yet still profitable which is RM 12, 677 in year 1 and increased to RM 18, 560 in year 5. This occurred due to low percentageof acetic acid

in pure dokong vinegar, thus required only small dilution compared to rambutan vinegar. For the balance sheet, forrambutan vinegarnet asset and shareholder net worth for year 1 is balanced which is RM 16, 949while for dokong vinegar is RM 11, 823.

	Rambutan Vinegar		Dokong Vinegar,		
	Year 1	Year 5	Year 1	Year 5	
Starting Capital	RM 10,000	-	RM 10,000	-	
Cost of sales	RM 99,437	RM 145,585	RM33,979	RM49,749	
Sales of vinegar	RM 138,240	RM 202,397	RM46,656	RM68,309	
Gross profit	RM 38, 803	RM 56, 812	RM 12, 677	RM 18, 560	
Profit/loss after taxation	RM 6,949	RM 10, 478	RM 1,823	RM 2,972	
Net asset	RM 16, 949	RM 53, 148	RM 11, 823	RM 21, 851	
Shareholder net worth	RM 16, 949	RM 53, 148	RM 11, 823	RM 21, 851	

Table 4: Profitability Statements of local Fruits' Vinegars

The net present value (NPV) is the present value of an investment's future net cash flows minus the initial investment. If positive, the investment should be made unless an even better investment exists, otherwise it should not. In this study, the NPV is positive gained in year 2 which is RM 6,912.00for rambutan vinegar while dokong vinegar is in year 4 at RM 2,251.64. The internal rate of return (IRR) is a rate of return used in capital budgeting to measure and compare the profitability of investments. In the context of savings and loans the IRR is also called the effective interest rate. The IRR of rambutan vinegar is 30% where the present value in year 2 is RM 11,495.10 while for dokong vinegar is 10% in year 5 where the present value is RM 11,537.41. Benefit or cost ratio is the ratio of the net present values of measurable benefits to costs where value above 1 simply means the investment is beneficial. This showed that rambutan and dokong vinegars are beneficial investment where rambutan vinegar cost ratio is 3.771 while dokong is 1.440.Payback period in capital budgeting refers to the period of time required for the return on an investment to "repay" the sum of the original investment. Payback period for RM10,000 initial investment for rambutan vinegar is in year 2 which is RM 11,495.10 while for dokong vinegar is in year 5 which is RM 11,851. The actual cost of projects may deviate on change of any of the assumptions.

Table 5:	Forecast	Key	Indicators
----------	----------	-----	------------

	Rambutan Vinegar	Dokong Vinegar,
NPV	Year 2 = RM 6,912.00	Year 4 = RM 2,251.64
IRR	Year 2 = RM 11,495.10 (30%)	Year 5 = RM 11,537.41 (10%)
Benefit/Cost ratio	3.771	1.440
Payback period	Year 2 = RM 11,495.10	Year 5 = RM 11,851

Table 6 showed there were 69 respondents from Kuala Lumpur (KL) and 108 respondents from Kelantan. Compare with the aged, most of the respondents are within the age group of 25-34yr (41.2%) following by the age group of 18-24yr (35.0%), 35-44yr (11.9%), 45-54yr (7.9%) and 55yr and above (4.0%). While for gender, there were 47.5% and 52.5% of Male and Female respondents respectively. Around 46.9% of respondents are married, 52.5% single and 0.6% from respondents are windowed. For the Education level, most of the respondents are at university level (58.8%) and Secondary school level (19.8%) following by Certificate (12.4%), Others education level (7.3%), Primary school (1.1%) and not attend to formal school (0.6%). Among all the respondents, there are 83.1% Malay, 14.1% Chinese, 1.1% of Indian and 1.7% people from other races. For religion, there are 83.6% of Muslims, 9.6% of Buddhist, 4.5% of Christians, 1.1% of Hindus and people from others religion are 1.1%. Moreover, people who are working in public sector are 41.8%, Students or Unemployed are 23.2%, private sector 14.1%, other options 11.3%, self-employed 6.2%, Housewife and Retired people from the total respondents are both 1.7% respectively. Furthermore, Income of respondents is mostly at the level of less than RM2000 (55.4%), follow by category of RM2001-RM4000 (31.6%), RM4001-RM6000 (11.3%) and RM6001 and above (1.7%).

Table 6: Respondents Demographic Caracteristic

Asia Pacific Institute of Advanced Research (APIAR)

To determine the consumers' perception, general information and knowledge about vinegar have been collected in this study. Table 7 presents the respondents' awareness towards vinegar product. There are 39.55% of respondents are from Kelantan and 29.38% of Kuala Lumpur people responded that they like vinegar in general. Meanwhile, 21.47% are from Kelantan and 9.60% of from Kuala Lumpur people dislike vinegar product in general. This result shows respondents from the two regions are consumers for vinegar, especially respondents in Kelantan.

Among people who responded that they like vinegar product, 16.36% of respondents from Kelantan and 8.20% of respondents from Kuala Lumpur preferred Artificial Vinegar. Meanwhile 37.70% of that respondent from Kelantan and 33.61% of respondents from Kuala Lumpur preferred Natural Vinegar. This show Natural Vinegar is more preferred by the consumers in both regions compared to artificial vinegar. Furthermore, for people who preferred Natural vinegar, 33.61% of respondents from both regions tend to take natural fruits vinegar compared to Nipa vinegar (20.49% Kelantan; 6.56% Kuala Lumpur). Most of the respondents from both regions (33.15% Kelantan and 22.95% Kuala Lumpur) consume vinegar several times a week. In addition, 30.33 % of respondent from Kelantan acknowledge the benefits of vinegar compared the Kuala Lumpur (28.69%).

Table 7 The Comparison respond of customers' preferences and Knowledge towards vinegar products

Statement	Kelantan n (%)	Kuala Lumpur n (%)

No	33 (27.05)	17 (13.93)

Findings show all factors or variables are related to each other. Genders (vs) Frequency for usage of vinegar achieve the highest record (0.989) as shown in Table 8. It is followed by Races (vs) choice for type of vinegar (0.896), Religion (vs) choice for type of vinegar (0.888) and marital status (vs) Brand of vinegar (0.852). The lowest record fall under variable of marital status (vs) choice for type of vinegar with 0.07, but it is still consider as a significant factor due to it reading is higher than 0.05. From the research, we can conclude that preference on type of vinegar and natural vinegar is depending on Gender, Race and Religion of the respondents. Brand of vinegars being purchased is depending on Gender, Marital status and Race. Knowledge of vinegars benefits depending on Religion and Occupation. It seems that Gender, Race and Religion are playing important factors in determining the customer preferences on vinegars.

Table 8: Pearson Chi-Square Coefficient (n=177) (knowledge about vinegar)

Factors	Like vinegar	Type of Vinegar	Type of Natural Vinegar	Brand of Vinegar	Frequency for usage of Vinegar	Knowledge of Vinegars benefits
Gender	0.097	0.837	0.664	0.599	0.989	0.34
Marital status	0.218	0.07	0.24 40	0.852	0.557	0.476
Race	0.168	0.896	0.623	0.71	0.66	0.323
Religion	0.114	0.888	0.832	0.415	0.378	0.644
Occupation	0.337	0.247	0.276	0.626	0.096	0.581

Conclusions

From the results, local fruits vinegars from Rambutan and Dokongvinegars have significantly good source of nutrition based on their excellence nutritional profiles and quality attributes. Both products could be a beneficial investment based on the forecast accounts. Overall resultsof respondents from Kelantan and Kuala Lumpur both have high percentage on acceptance for Natural Fruit Vinegar products. Gender, Race and Religion are playing important factors in determining the customer preferences on vinegars. This could be an indication to show that market potential for tropical natural product is positive in Malaysia.
